PROFILE

Software engineer with eight years building production Python, Rust, and distributed systems across Google, Bloomberg, and Edgestream. For the past six months, full-time architect and maintainer of **sase** (sase.sh), an open-source multi-agent developer platform and meta-harness unifying 7 coding-agent harnesses (Claude Code, Codex, Antigravity, Qwen Code, OpenCode, Muse Code, Grok Build) behind isolated workspaces, typed approval gates, and deterministic evaluation benches. Proven track record in high-throughput backend services, extensible test frameworks, and mission-critical developer tooling.

EXPERIENCE

SASE (sase.sh) — New York, NY
Founder & Lead Software Engineer — May 2026 – Present

- Architected and developed **sase**, an open-source meta-harness and multi-agent execution platform supporting 7 agent harnesses behind a unified provider abstraction (`llm_provider/base.py`) with model routing and isolated git workspaces.
- Engineered high-performance backend domain services in Rust (`sase-core-rs`) paired with a Python 3.12+ control plane and the **AXE** daemon scheduler for reliable, non-blocking multi-agent execution.
- Built the **fakey** deterministic conformance harness to simulate LLM streaming, token limits, interrupts, retries, and failure modes, enabling hermetic, zero-cost regression testing of agent lifecycles.
- Designed human-in-the-loop governance primitives including typed gates (plan, questions, sudo) with persisted audit trails, queue budgets, and Prometheus telemetry surfacing 33+ pipeline and agent health metrics.

Google — Manhattan, NY
Software Engineer — June 2022 – May 2026

- Full-stack software engineer on Google Ad Manager; engineered high-throughput, low-latency Java backend services and modern web applications using Dart / AngularDart / Sass.
- Maintained 99.99%+ availability and strict latency SLAs across globally distributed ad-serving and reporting pipelines processing billions of daily events.
- Collaborated across cross-functional infrastructure teams to design resilient APIs, internal developer workflows, and automated release validation pipelines.

Bloomberg L.P. — Manhattan, NY
Site Reliability Engineer / Senior Software Engineer — January 2021 – May 2022

- Founding engineer on the Compliance SRE (CSRE) team; technical lead across the team's Python service and tooling portfolio.
- Maintained Bloomberg's firm-wide Python project cookiecutter, standardizing dependency management, test scaffolding, and CI/CD quality gates across hundreds of engineering teams.
- Authored and rolled out the "ChangeLog Driven Release" (CLDR) methodology, adopted in alpha across the Compliance department to automate release verification and auditable semantic versioning.

Edgestream Partners, L.P. — Princeton, NJ
Software Engineer — May 2019 – January 2021

- Architected large-scale enhancements to the production department's in-house testing framework and test runner, accelerating test suite execution and test determinism for automated Linux trading systems.
- Spearheaded integration of `pylint` across a legacy codebase of 1M+ lines of Python; built custom static analysis extensions and CI tools to enforce code quality without degrading developer velocity.
- Lead developer of Edgestream's investor-facing portal, built with Python, Django, and PostgreSQL.

Comcast — Mount Laurel, NJ
Tier III Technical Support — 2011 – 2016

- Diagnosed chronic network outages across carrier-grade infrastructure; automated frequent department data-aggregation and ticketing workflows using Python scripting.

EDUCATION

Rutgers University — New Brunswick, NJ
B.S. Computer Science (minor in Mathematics) — September 2015 – May 2019

SKILLS

AI & Agentic Systems	Multi-agent orchestration · meta-harness design · agent evaluation & benchmarking · conformance harnesses · Claude Code · Codex · Antigravity · prompt engineering · structured tool use
Languages	Python (3.12+) · Rust · Java · C/C++ · Bash · SQL · Dart · Perl · JavaScript · LaTeX
Systems & Reliability	Linux internals · TCP/IP networking · distributed systems · CI/CD pipelines · test automation frameworks · observability (Prometheus / Grafana)
Data & Tools	Git · Docker · PostgreSQL · Redis · ZeroMQ · Pluggy · FastAPI · Django · Textual · Vim

SELECTED OPEN-SOURCE PROJECTS

sase — Structured Agentic Software Engineering — `Python, Rust`
Multi-agent meta-harness platform orchestrating 7 coding agents. — 2025–present

- Unified 7 provider CLIs behind a single interface with isolated workspace directories, YAML-driven multi-step workflows, and a Textual-based terminal supervision console (**ACE**).
- Implemented deterministic replay and failure benchmarking with the `fakey` conformance harness; published detailed documentation, release notes, and guides at sase.sh.

psf/black — `Python`
The uncompromising Python code formatter. — 2019–2021

- Overhauled Black's string-handling engine (~3,500 LoC) in PR #1132; resolved five distinct, longstanding open GitHub issues.

python-boltons/* — `Python`
Modular production Python libraries built for enterprise stability. — 2021–present

- Founder and maintainer of open-source libraries: `cc-python` (cookiecutter), `clack` (CLI configuration), `eris` (typed error handling), `hush` (plugin secrets), and `logrus` (structured logging).

bbugyi200/funky — `Python, Shell`
Interactive shell function manager (500+ GitHub stars). — 2017–2021

- Created shell utility with active community adoption, accepting external code contributions and feature requests.

bbugyi200/* — `Python, Rust, Shell`
Selected utilities and systems tooling. — 2017–present

- `cookie` (template file generator, 250+ stars) · `shv` (Rust shell-history viewer) · `cldr` (ChangeLog Driven Releases) · `greatday` (GTD task manager).
