Bryan Bugyi

Software Engineer • Developer Tools, Reliability & Agent Infrastructure — Cranford, NJ (NYC metro)
bryanbugyi34@gmail.com • (609) 864-9328 • github.com/bbugyi200 • linkedin.com/in/bryan-bugyi • sase.sh

Software engineer with seven years at Google, Bloomberg, and Edgestream, focused on making change safe to ship: launches, shard migrations, and release on-call at Google; SRE and release process at Bloomberg; test and lint tooling at Edgestream. Since May 2026, building **sase** full-time.

EXPERIENCE

sase • SASE = Structured Agentic Software Engineering — May 2026 – Present
Creator & Lead Engineer (independent, full-time) — sase.sh

- Designed an open-source meta-harness for seven coding-agent CLIs (Claude Code, Codex, Antigravity, and four more) under one contract; each run gets a workspace clone, and the host commits and opens pull requests.
- Built spec-driven VCS-agnostic planning (Git, Mercurial): reviewer decisions on plans and multi-phase epics; approved epics as dependency-tracked beads for separate agents; prompt macros for multi-step workflows.
- Added durable project memory (core notes inlined into every provider's instructions, reference notes read on demand and audited) and typed approval gates (plans, launches, sudo) answerable from the TUI, CLI, or Telegram.
- Moved shared logic into a required Rust core (PyO3) that also serves an authenticated gateway for phones and remote machines; added pluggy plugins for GitHub PRs, Telegram, Neovim, and Markdown-to-MP3 audio.

Google • Ad Manager — Jun 2022 – May 2026
Software Engineer — New York, NY

- Designed and launched per-inventory ad expansion and contraction rules for Ad Exchange publishers (Java APIs, AngularDart UI, default-rule backfills): open beta for all publishers in 2024, then extended to collapsible-anchor and collapsible-banner ads (all publishers, Oct 2024).
- Migrated production API services between backend shards using read-only shadow traffic and error-comparison analysis: one to 100% of traffic (2024), a second into a staged production ramp (2025–26).
- Designed and built category targeting for manual creative-review protections end to end, from schema and Java validation to a reusable Dart category picker; launched to a beta publisher cohort (Aug 2025).
- Served on API release on-call (four releases a week) and build-cop and bug-lead rotations: triaged release-blocking alerts, rolled back bad canaries, and cherry-picked fixes into new release candidates.

Bloomberg L.P. • Compliance SRE — Jan 2021 – May 2022
Site Reliability Engineer / Senior Software Engineer — New York, NY

- Founding member of the Compliance SRE team; led most of the team's software projects, primarily in Python.
- Created the ChangeLog Driven Release (CLDR) methodology, piloted in alpha across the Compliance department.
- Maintained Bloomberg's community cookiecutter, the shared starting template for new Python projects.

Edgestream Partners, L.P. • production trading team — May 2019 – Jan 2021
Software Engineer — Princeton, NJ

- Led the integration of pylint into a 1M+ line Python trading codebase, building the tools that made the rollout succeed.
- Improved the production team's in-house test framework and test runner for its Linux-based trading system.

OPEN SOURCE

- **psf/black** (42K stars): improved long-string handling (PR #1132, +3.5K lines, merged 2020), closing five open issues.
- **funky** (670+ stars), a shell-function manager, and **cookie** (280+ stars), a template file generator.

EDUCATION

Rutgers University — 2015 – 2019
B.S. Computer Science, minor in Mathematics — New Brunswick, NJ
