## PROFILE

Software engineer with seven years of production Python, SRE, and developer-tooling work at Google, Bloomberg, and Edgestream. Since May 2026, building **sase** full-time: an open-source control plane that runs seven coding-agent CLIs as supervised, isolated, recorded engineering work — the same problem space as Databricks' Omnigent. I focus on the infrastructure that makes agent work trustworthy: durable run records, regression triage that separates new failures from known and flaky ones, deterministic test harnesses, and human-approval gates.

## EXPERIENCE

### sase — Structured Agentic Software Engineering

Open source • sase-org/sase
Creator & Lead Engineer (independent, full-time)
May 2026 – present

- Designed one provider contract over seven agent CLIs (Claude Code, Codex, Antigravity, Qwen Code, OpenCode, Muse Code, Grok Build) with cross-provider model routing. Each agent is a single-turn job in an atomically claimed workspace clone; the host, never the agent, commits, opens PRs, and records the outcome.
- Built the verification layer agents work inside: every check or test execution becomes a durable **ToolRun** record (before/after repository fingerprints, normalized failure signatures) with a triage verdict — `NEW`, `KNOWN`, `FLAKY`, or `UNKNOWN` — where `KNOWN` requires an independent witness and exit codes are never masked.
- Wrote `fakey`, a deterministic fake provider that drives the real launch, streaming, retry, and interrupt paths with no model calls; paired it with a per-commit fast CI gate, a scheduled exhaustive CI lane, and a flake-baseline gate.
- Moved shared backend logic into a required Rust core (`sase-core`, PyO3 bindings) that also serves an authenticated HTTP gateway for mobile clients and multi-machine dispatch, plus a SQLite telemetry store.
- Shipped typed human-approval gates (plan, question, launch, sudo) answerable from the Textual TUI, CLI, Telegram, or phone, with every decision recorded.
- Started as a side project in 2025; now my daily engineering environment — sase is developed by agents running under sase. Released on PyPI (MIT) with docs at sase.sh.

### Google

Manhattan, NY
Software Engineer
June 2022 – May 2026

- Full-stack engineer on Google Ad Manager; Java on the backend, Dart / AngularDart / Sass on the frontend.

### Bloomberg L.P.

Manhattan, NY
Site Reliability Engineer / Senior Software Engineer
January 2021 – May 2022

- Founding engineer on the Compliance SRE (CSRE) team; technical lead across the team's Python portfolio.
- Authored the "ChangeLog Driven Release" (CLDR) release methodology and tooling; adopted in alpha across the Compliance department.
- Maintained Bloomberg's firm-wide Python cookiecutter, shaping new-project scaffolding across the company.

### Edgestream Partners, L.P.

Princeton, NJ
Software Engineer
May 2019 – January 2021

- Delivered large-scale improvements to the production team's in-house testing framework and test runner.
- Led integration of `pylint` into a 1M+ line Python trading codebase; built the supporting tooling to make it stick.
- Lead developer of Edgestream's Django-based investor-facing web portal.

### Comcast

Mount Laurel, NJ
Tier III Technical Support
2011 – 2016

- Diagnosed large-scale network outages; automated recurring team workflows (ticketing, spreadsheet parsing, info retrieval) with Python.

## SKILLS

| | |
|---|---|
| **Agent Systems** | provider adapters · workflow orchestration · regression triage · flake detection · human-approval gates · Claude Code · Codex |
| **Primary** | Python · Linux · Bash · TCP/IP networking |
| **Working** | Rust · Java · Dart · C/C++ · JavaScript · SQL |
| **Infrastructure** | pytest · GitHub Actions · Docker · Git · PostgreSQL · SQLite · Redis · PyO3 |
| **Frameworks** | Textual · FastAPI · Django · Flask · Pluggy · ZeroMQ |

## SELECTED OPEN SOURCE

- **psf/black** — rewrote the formatter's string-handling logic (~3,500 LoC) in PR #1132 (merged 2020), closing five unrelated user-filed issues.
- **bbugyi200/*** — `funky` (650+ stars; shell-function manager) · `cookie` (280+ stars; templated file generator) · `cldr` (ChangeLog Driven Releases) · `shv` (Rust shell-history viewer).
- **python-boltons/*** — founder and lead developer: `cc-python`, `clack`, `eris`, `hush`, `logrus`.

## EDUCATION

**Rutgers University** — New Brunswick, NJ
B.S. Computer Science (minor in Mathematics) — September 2015 – May 2019
