Bryan Bugyi

Software Engineer • Developer Tools, Reliability & Agent Infrastructure

bryanbugyi34@gmail.com • (609) 864-9328 • github.com/bbugyi200 • linkedin.com/in/bryan-bugyi • sase.sh

Software engineer with seven years at Google, Bloomberg, and Edgestream, focused on making change safe to ship: launches, shard migrations, and release on-call at Google; SRE and release process at Bloomberg; test and lint tooling at Edgestream. Since May 2026, building **sase** full-time.

EXPERIENCE

sase • Structured Agentic Software Engineering — May 2026 – Present

Creator & Lead Engineer (independent, full-time) — sase.sh

- Designed an open-source meta-harness that drives seven coding-agent CLIs (Claude Code, Codex, Antigravity, and four more) through one contract; each run gets its own workspace clone, and the host commits and opens pull requests.
- Built spec-driven planning on a VCS-agnostic layer (Git and Mercurial): plans and multi-phase epics carry reviewer decisions, approved epics become dependency-tracked beads worked by separate agents, and prompt macros compose multi-step workflows.
- Added durable project memory (core notes inlined into every provider's instructions, reference notes read on demand and audited) and typed approval gates (plans, launches, sudo) answerable from the TUI, CLI, or Telegram.
- Moved shared logic into a required Rust core (PyO3) that also serves an authenticated gateway for phones and remote machines; added pluggy plugins for GitHub PRs, Telegram, Neovim, and Markdown-to-MP3 audio.
- Built the verification layer (durable check records, normalized failure signatures, new/known/flaky/unknown verdicts; exit codes are never masked) and `fakey`, a deterministic fake provider behind a per-commit release gate.
- Started as a 2025 side project; 29 PyPI releases since Feb 2026 (MIT license); now developed day to day by agents running under sase.

Google • Ad Manager — Jun 2022 – May 2026

Software Engineer — New York, NY

- Designed and launched per-inventory ad expansion and contraction rules for Ad Exchange publishers (Java APIs, AngularDart UI, default rules backfilled for every network) to an open beta for all publishers in 2024; the first exchange rule built on Ad Manager's next-generation API stack.
- Added collapsible-anchor and collapsible-banner controls to those rules, from closed beta (May 2024) to all publishers (Oct 2024), then retired the launch flags and the legacy settings they replaced.
- Migrated production API services between backend shards using read-only shadow traffic and error-comparison analysis: one to 100% of traffic (2024), a second into a staged production ramp (2025–26).
- Designed and built category targeting for manual creative-review protections end to end, from schema and Java validation to a reusable Dart category picker; launched to a beta publisher cohort (Aug 2025).
- Took over and shipped the bidder data-usage declarations UI (conflict badges, filters, and setting suggestions across nine declaration types) to beta publishers (Aug 2025).
- Served on API release on-call (four releases a week) and build-cop and bug-lead rotations: triaged release-blocking alerts, rolled back bad canaries, and cherry-picked fixes into new release candidates.
- Authored 20+ approved design docs and earned Java and Dart readability, Google's language-level code-review certifications.

Bloomberg L.P. • Compliance SRE — Jan 2021 – May 2022

Site Reliability Engineer / Senior Software Engineer — New York, NY

- Founding member of the Compliance SRE team; led most of the team's software projects, primarily in Python.
- Created the ChangeLog Driven Release (CLDR) methodology, piloted in alpha across the Compliance department.
- Maintained Bloomberg's community cookiecutter, the shared starting template for new Python projects.

Edgestream Partners, L.P. • production trading team — May 2019 – Jan 2021
Software Engineer — Princeton, NJ

- Led the integration of pylint into a 1M+ line Python trading codebase, building the tools that made the rollout succeed.
- Improved the production team's in-house test framework and test runner for its Linux-based trading system.
- Lead developer of the investor-facing web portal, built with Django.

Comcast — 2011 – 2016
Tier III Technical Support — Mount Laurel, NJ

- Resolved chronic and multi-customer network issues with engineering teams; spotted outages in ticket data and automated ticketing and spreadsheet tasks in Python.

OPEN SOURCE

- **psf/black** (42K stars): improved long-string handling (PR #1132, +3.5K lines, merged 2020), closing five open issues.
- **funky** (670+ stars), a shell-function manager, and **cookie** (280+ stars), a template file generator; both accepted outside contributions.
- Also `cldr` (changelog-driven releases), `shv` (Rust shell-history viewer), and `python-boltons` (small Python libraries such as `clack` and `logrus`).

SKILLS

Languages	Python • Java • Dart • Rust • Bash • SQL
Infrastructure	Linux • Git • GitHub Actions • Docker • PostgreSQL • SQLite • Redis • Protocol Buffers
Frameworks	AngularDart • Django • FastAPI • Flask • Textual • PyO3 • pytest
Agent tooling	Claude Code • Codex • multi-agent orchestration • failure triage • human-approval gates

EDUCATION

Rutgers University — 2015 – 2019
B.S. Computer Science, minor in Mathematics — New Brunswick, NJ
